

Aerial runways are available in lengths of between 20 and 50 meters, the steel cable is suspended on heavy duty galvanised tubular steel frames that can be powder coated to almost any colour.

They can be installed with a start ramp for a level site, or without a ramp for a site with a natural fall.

At the end of the ride the user is gradually brought to a halt by a spring brake system.

*Stainless steel ratchet cable tensioner for easy cable adjustment.*

*The stainless steel carriage has nylon wheels for quiet running and an automatic brake that keeps it stationary when there is no weight on the seat.*

*A shock absorbing rubber button seat is suspended by an easy to hold, plastic coated galvanised chain.*
