# SAMIFLEX ELASTOMERIC COUPLINGS

Now there's a new solution to one of the most costly and troublesome problems facing maintenance personnel - coupling failure and the expensive down time associated with fixing it.

## Only four parts to the Samiflex Coupling

The two identical hubs (items A & B) are manufactured in cast iron, cast steel or aluminium alloy and incorporate four, six or eight teeth, depending on size rating of the coupling. A precision cast and machined polyurethane insert (item C) fits between the hubs and is split axially so fitting and removal can be achieved without moving hubs. The holding ring, manufactured in steel, polyamide or bronze (item D) is fitted over the insert securing both insert and ring between hubs. The coupling requires no bolts or nuts.

## Assembly & Disassembly

Once hubs (A) and (B) and holding ring (D) have been installed and aligned on the shafts the coupling hubs will not have to be moved again during the life of the equipment. The elastic insert (C) can then be installed between the parallel slots formed by the hub teeth.

With the insert in position, slide the retaining ring (D) into position over the polyurethane insert. Centrifugal force will expand the insert under operation ensuring a tight, secure fit inside the retaining ring.

Removing and replacing the coupling insert is very simple and requires no special tools. By removing the retaining ring, the insert can be quickly and easily removed and replaced without the need to undo screws, bolts or other fasteners.

## ATEX Approval

The range of Samiflex Couplings has been approved under ATEX directive 94/9/EC - for use in potentially explosive atmospheres.

## Features and Benefits

- Coupling insert removable without the need to remove either driving or driven equipment.
- Change out of coupling insert is faster than any other coupling.
- No lubrication or maintenance required over the life of the insert.
- The polyurethane insert can be supplied in a variety of hardnesses to optimise torque capacity and damping.
- Polyurethane insert is very resistant to chemical attack.
- Standard insert can handle large temperature range from -40 to 80 °C.
- High temperature insert available up to 150 °C.
- Hubs can be rotated independently during motor test.
- No metal to metal contact
- Large bore to torque capacity
- Vertical operation possible with standard coupling.
- Retaining rings provided with locking screws as standard.

*The specification contained within this brochure are correct at time of going to print. Autogard are continually reviewing and updating the specifications on all its product range and therefore reserve the right to change any detail.*

# SAMIFLEX THE ELASTIC INSERT

The Samiflex elastic insert is manufactured from a special blend of polyurethane compound manufactured to best meet the demanding characteristics of a high performance elastic coupling.

Samiflex elastic inserts are offered in three styles of compound and four hardness ratings allowing the most appropriate insert to be selected for the application.

The standard elastic insert is supplied at 95 shore and is a yellow colour. High performance inserts type HD and HDT are coloured ochre and red respectively and enable Samiflex torque ratings to be increased by 40% (consult factory).

Insert	Ref.	Hardness	Colour	Temp. Rating
Standard	STD	80 Shore A	Clear	-40 / 80 C
		90 Shore A	Blue	
		95 Shore A	Yellow	
High Temp.	HT	95 Shore A	Orange	-40 / 140 C
High Performance	HD	97 Shore A	Ochre	-40 / 80 C
	HDT	97 Shore A	Red	-40 / 140 C

## Coupling Selection

### Method

Data required for Coupling Selection.

- Application details (for service factor)
- Kilowatt and rpm of the driver.
- Shaft details of the driving and driven equipment.

- (1) Determine the service factor (SF) from the application and classification lists noted below.
- (2) Calculate the maximum Kw/1000 rpm rating:  

$$\text{Kw/1000 rpm} = (\text{Kw} \times 1000 \times \text{SF}) / \text{rpm}$$
 Select the coupling which has a higher max rating.
- (3) Compare the maximum rpm capacity & bore requirements to the catalogue limits for the coupling selected.

### Example

Driver: Water Turbine (75 Kw at 1500 rpm)  
 Driven equipment: Screw Compressor  
 Turbine Bore: 60 mm Compressor Bore: 50 mm  
 Distance Between Shaft Ends: 140 mm

Service Factor for the Water Turbine & Screw Compressor: SF = 2

$$\text{Kw/1000 rpm} = (75 \text{ Kw} \times 1000 \times 2) / 1500$$

$$\text{Kw/1000 rpm} = 100$$

Coupling selection based on max rating: A4B  
 Coupling Bore Capacity: 75 mm  
 Maximum Speed for the A4B is 3275 rpm unbalanced.  
 DBSE for the A4B Type SP is 140 mm  
 The A4B Type SP is acceptable in this application.

## Service Factors - SF

Load Characteristics	Electric Motor, Steam Turbine, Gas Turbine	Steam Engine, Water Turbine, 8 Cyl. Recip. Engine	6 Cyl. Recip. Engine	4 Cyl. Recip. Engine

1) STD Inserts will be supplied as standard unless specified. High Torque (HD), High Temperature (HT) or High Torque & Temperature (HDT) Inserts can be supplied upon request.

2) Maximum unbalanced speeds are based on Cast Iron Hubs. Higher speeds may be attained using Ductile Iron or Steel Hubs - Consult Autogard

3) Distance Between Shaft ends (DBSE) is based on the shafts mating flush with the end of the hub face. Shorter or longer shaft separations may be obtained by overhanging the shaft or hub

4) Weights and inertias are based on solid hubs.

5) Peak torque is 2 x maximum continuous torque.
