

DEXION®

Speedlock P90 Pallet Racking

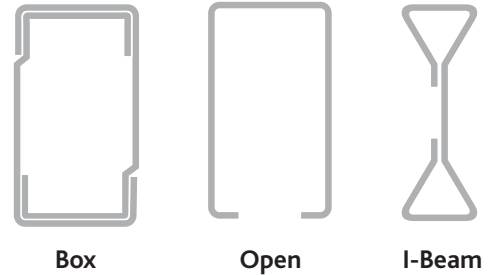

The versatile solution for static
and dynamic pallet storage

- Reliable, robust and versatile
- High stability
- Extensive range of accessories
- Wider choice for better performance
- Rack height up to 30 metres
- Bay loads of more than 30 metric tonnes
- Beam loads up to 5 metric tonnes
- Beam lengths up to 5,000mm

P90 is fabricated in Dexion's own factories, with its customary high quality and exceptionally robust manufacturing processes. It is also particularly versatile in use thanks to its extensive accessories - from a simple static pallet rack through various different dynamic solutions and all the way to automated pallet storage.

In addition to the traditional open and box sections, Dexion can also supply a completely new type of beam that was developed at our factory in Norway. This beam is based on an inherently strong I-section profile and does away with the need for welded joints with the use of 'tox' connectors. Tox connectors were originally developed for the automotive industry and use a punch and die combination to create a joint that is as sturdy as any welded seam.

P90 copes with heights up to 30m and maximum loads of more than 30 tonnes. All components can be galvanised with permanent protection against environmental effects.

P90 for fast-moving seasonal items.

P90 drive-in racks can make up to 90% more storage space compared to conventional pallet racking systems.

This smoothly formed pallet-carrying rail offers a safe, snag free surface. Pallet rails are carried on brackets that slot into the upright at 50mm pitch and are pin-locked in position.

Taking quality and efficiency to new heights
