

Tank Refurbishment

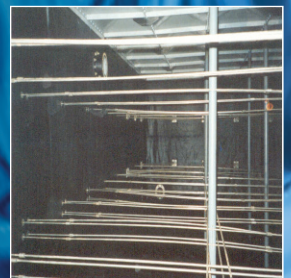

BEFORE

Franklin Hodge Industries can offer a comprehensive tank refurbishment service. Where an existing tank shell can be re-used, an effective tailor made service can be offered that will renew the existing installation and provide many years of faithful service. If necessary complete replacement tanks can be provided. Franklin Hodge Industries can refurbish the following types of tanks:

- Fire sprinkler
- Potable / Cold water services / Building services
- Industrial process water

Refurbishment of existing tanks can save both time and money, as well as cutting to the minimum the inconvenience of a shut off water system, be this for a fire sprinkler or potable / cold water services / building services tank. In the case of potable / cold water services / building services tanks, it is vitally important that the stored water be kept in a wholesome condition, as required under the Water Supply (Water Fittings) Regulations 1999, Health & Safety at Work Acts and Control of Substances hazardous to health regulations.

DURING

AFTER

Benefits of the Franklin Hodge Tank Refurbishment Service...

Rapid installation - most small cold water services tanks can be drained, cleaned, insulated, lined and refilled in one working day.

Comprehensive bespoke service - specific needs of each system catered for.

Peace of mind - ISO9001 approved company, using drinking water approved materials, with three over decades of experience.

Tank refurbishment Technical Data

The tank refurbishment service from Franklin Hodge Industries comprises the cleaning and de-scaling of the internal surface of the existing tank and the fitting of a tailored liner, manufactured from a drinking water approved Butyl rubber material. Between the internal liner and the tank wall, insulation material can be fitted, to stabilise the temperature of the stored water, in line with Water Regulations.

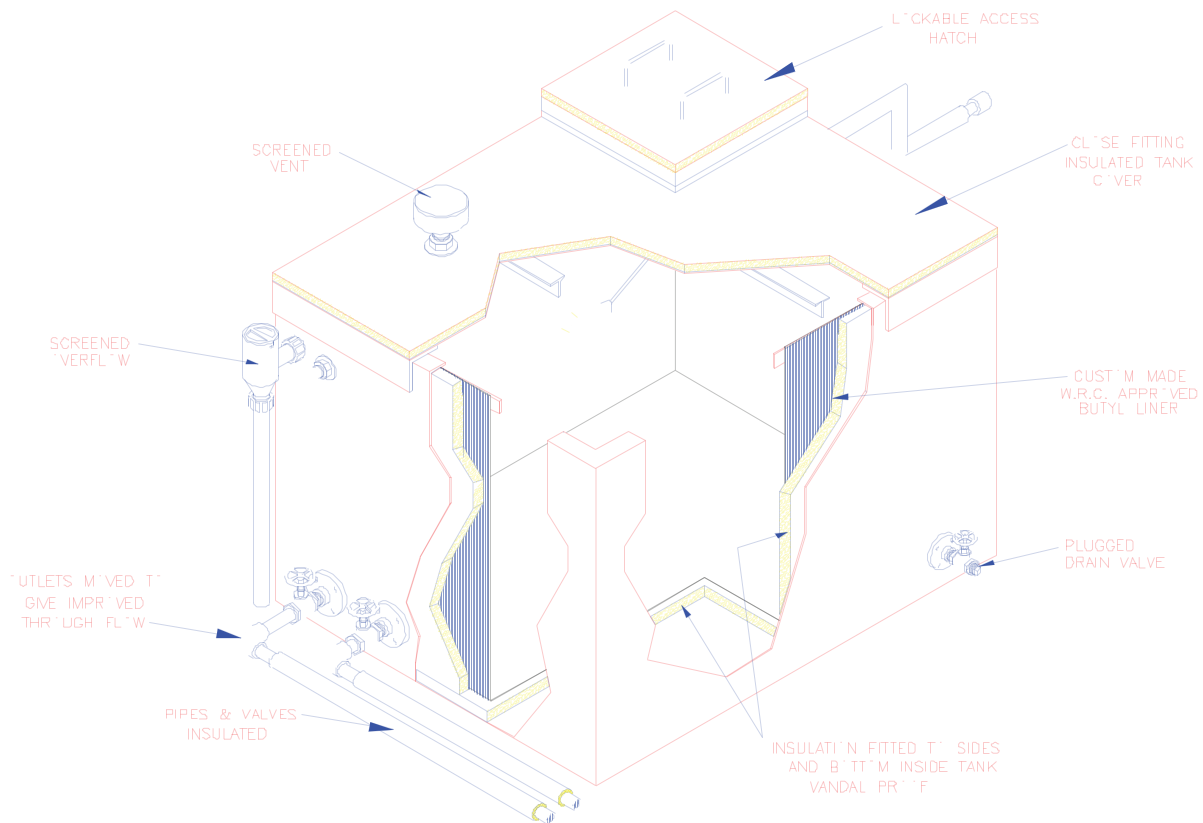

The advantage of this system is that the insulation is 'encapsulated' and therefore not prone to vandal or accidental damage. To ensure that the interior of the refurbished tank is kept free from dirt, vermin and insects, Franklin Hodge have designed a lightweight, mechanically fixed low maintenance vented tank cover, which is fitted with an access hatch above the ball float valve.

These covers can be tailored to fit in restricted areas and are delivered to site in sections.

If the existing tank panels have deteriorated to an unacceptable condition, replacement panels can be speedily fitted on site.

Where possible or desirable, existing pipework connection positions on the tank wall are re-sited to conform with current Water Regulations and maximise throughflow.

The benefits of this system are principally that there is no curing time as with paint systems and once refurbished, maintenance of the tank is straightforward.
