

Master Bond Inc.

Adhesives, Sealants and Coatings

Adhesives for Medical Industry

We are a leading company in the design, formulation and manufacture of adhesives, sealants, coatings and potting compounds for the assembly of disposable, reusable and implantable medical devices. Master Bond's product line includes epoxies, urethanes, silicones, cyanoacrylates, and specialty solvent based systems. These products can be cured at ambient and/or elevated temperatures or by exposure to UV light. Specific formulations fully meet the

USP Class VI protocol. Master Bond's technical staff welcomes the opportunity to provide assistance to medical device manufacturers in the solution of specific assembly problems.

These compounds can simplify and enhance the performance of many critical medical devices. Formulations have been developed which offer high physical strength properties and outstanding chemical resistance even when applied on dissimilar or difficult-to-bond materials. Additionally, selected products retain their desirable performance upon exposure to various sterilization procedures including autoclaving, radiation, ethylene oxide and the recently developed cold sterilants. These compounds can be used in a wide variety of devices such as diagnostic instruments (endoscopes, etc.), surgical tools, catheters and implantables.
