

Large Diameter Pipe Boxing

The conveying of pipework systems throughout a property is a complex part of any project that requires a lot of thought and planning.

Once the run is agreed though and installation and testing has taken place the next stage is how to protect these pipe runs.

Having insulated what are usually fairly large diameter pipes, especially the Riser Mains, these can now be quite substantial in size.

The investment that has been made in the heating scheme, be that Ground Source Heating or Mains Gas, needs to be protected as much as possible, whilst making the valves to each property and at other points in the building accessible for authorised personnel in the future.

Sometimes other services also need to be included, such as the Riser Mains for Sprinkler Systems or other services.

Jtech Services specialise in providing Pipe Boxing Systems for these large scale applications.

Manufactured in either Steel or Aluminium the client can be confident that the finished product will be resistant to fire, especially as the powder coated finish that is used is an FR grade.

Being metal based the product is also robust and can take the knocks from continual traffic that are normal in large public housing schemes.

The product ranges from Jtech Services are ideally suited to both internal or external applications and as a detailed site measure of each project can be undertaken the installation is straightforward.

Whether your project requires just a few length's or needs a whole tower block to be protected Jtech Services will be pleased to work along with you, so that you get the best results.
