

RADEX[®]-N

Steel laminae couplings types

NN, NANA 1 to 4,
NENA 1 and 2, NENE 1
NNZ, NNW

according to Standard 94/9/EC
(ATEX 95) for finish bored, pilot
bored and unbored couplings

RADEX[®]-N type NN

RADEX[®]-N type NANA 1

RADEX[®]-N type NNZ

RADEX[®]-N type NANA 4

RADEX[®]-N type NNW

Schutzvermerk ISO 16016 beachten.	Gezeichnet: 27.02.12 Pz/Wb	Ersatz für: KTR-N vom 17.08.10
	Geprüft: 27.02.12 Pz	Ersetzt durch:

RADEX®-N is a torsionally stiff, flexible steel laminae coupling which is able to compensate for shaft misalignment caused by, for example, thermal expansion.

RADEX[®]-N couplings with attached parts that can generate heat, sparks and static charging (e. g. combinations with brake drums, brake disks, overload systems like torque limiters, impellers etc.) are not allowed for the use in hazardous areas. A separate checking must be made.

2 Hints

2.1 Coupling Selection

CAUTION!

For a continuous and troublefree operation of the coupling it must be designed according to the selection instructions (according to DIN 740 part 2) for the particular application (see RADEX[®]-N catalogue).

Please take into account the critical whirling speed of the types NANA 4 and NNW.

If the operating conditions (performance, speed, changes at engine and machine) change, the coupling selection must be checked again.

Please make sure that the technical data regarding torque only refers to the laminae sets.

The transmissible torque of the shaft/hub connection must be checked by the orderer, and he is responsible for the same.

For drives with endangered torsional vibration (drives with periodical load on torsional vibration) it is necessary to make a torsional vibration calculation to ensure a perfect selection. Typical drives with endangered torsional vibration are e. g. drives with diesel engines, piston pumps, piston compressors etc. On request KTR makes the coupling selection and the torsional vibration calculation.

Schutzvermerk ISO 16016 beachten.	Gezeichnet:	27.02.12 Pz/Wb	Ersatz für:	KTR-N vom 17.08.10
	Geprüft:	27.02.12 Pz	Ersetzt durch:	

2 Hints

2.2 General Hints

Please read through these mounting instructions carefully before you set the coupling into operation. Please pay special attention to the safety instructions!

The **RADEX®-N** coupling is suitable and approved for the use in hazardous areas. When using the coupling in hazardous areas please observe the special hints and instructions regarding safety in enclosure A.

The mounting instructions are part of your product. Please keep them carefully and close to the coupling. The copyright for these mounting instructions remains with **KTR Kupplungstechnik GmbH**.

2.3 Safety and Advice Hints

DANGER!

Danger of injury to persons.

CAUTION!

Damages on the machine possible.

ATTENTION!

Pointing to important items.

PRECAUTION!

Hints concerning explosion protection.

2.4 General Hints of Danger

DANGER!

With assembly, operation and maintenance of the coupling it has to be made sure that the entire drive train is protected against unintentional engagement. You can be seriously hurt by rotating parts. Please make absolutely sure to read through and observe the following safety instructions.

- All operations on and with the coupling have to be performed taking into account "safety first".
- Please make sure to disengage the power pack before you perform your work.
- Protect the power pack against unintentional engagement, e. g. by providing hints at the place of engagement or removing the fuse for current supply.
- Do not touch the operation area of the coupling as long as it is in operation.
- Please protect the coupling against unintentional touch. Please provide for the necessary protection devices and caps.

2.5 Proper Use

You may only assemble, operate and maintain the coupling if you

- have carefully read through the mounting instructions and understood them
- had technical training
- are authorized to do so by your company

The coupling may only be used in accordance with the technical data (see table 1 to 5 in chapter 1). Unauthorized modifications on the coupling design are not admissible. We do not take any warranty for resulting damages. To further develop the product we reserve the right for technical modifications.

The **RADEX®-N coupling** described in here corresponds to the technical status at the time of printing of these mounting instructions.

Schutzvermerk ISO 16016 beachten.	Gezeichnet: 27.02.12 Pz/Wb	Ersatz für: KTR-N vom 17.08.10
	Geprüft: 27.02.12 Pz	Ersetzt durch:

2 Hints

2.6 Hint regarding the Finish Bore

DANGER!

The maximum permissible bore diameters d (see table 1 and 2 in chapter 1 - Technical Data) must not be exceeded. If these figures are disregarded, the coupling may tear. Rotating particles may cause serious danger.

- Flange hub bores machined by the customer have to observe concentric running or axial running, respectively (see picture 11).
- Please make absolutely sure to observe the figures for d_{max} .
- Carefully align the flange hubs when the finish bores are brought in.
- Please provide for a setscrew acc. to DIN EN ISO 4029 with cup point or an end plate for the axial fastening of the flange hubs.

picture 11: concentric running and axial running

CAUTION!

The orderer is responsible for all subsequently made machinings to unbored or pilot bored and to finish machined coupling parts and spare parts. KTR does not assume any warranty claims resulting from insufficient refinish.

PRECAUTION!

Any mechanical rework to couplings that are used in hazardous areas require an explicit release by KTR.

The orderer must send a drawing to KTR acc. to which the manufacture must be made. KTR checks this drawing and returns it to the orderer with approval.

KTR supplies unbored or pilot bored coupling parts and spare parts on explicit customer's request. These parts are additionally labelled with the symbol

Table 6: setscrews DIN EN ISO 4029

3 Storage

The coupling hubs are supplied in preserved condition and can be stored at a dry and roofed place for 6 - 9 months.

CAUTION!

Humid storage rooms are not suitable.

Please make sure that there is no condensation. The best relative air humidity is under 65%.

4 Assembly

4.2 Assembly of the Flange Hub

ATTENTION!

We recommend to check bores, shaft, keyway and feather key for dimensional accuracy before assembly.

Heating the flange hubs slightly (approx. 80 °C) allows for an easier installation onto the shaft.

PRECAUTION!

Please pay attention to the danger of ignition in hazardous areas.

DANGER!

Touching the heated flange hubs causes burns.
We would recommend to wear safety gloves.

CAUTION!

During the assembly please make sure that the E dimension (see table 1 and 2) is observed, so that the coupling parts do not contact each other during the operation.
Disregarding this hint may cause damage on the coupling.

For the axial alignment of the coupling the dimensions E (see table 1 and 2) are decisive. In order to adjust the right dimension E you should proceed as follows:

- Push the flange hubs onto the shafts of the drive and driven side.
- The inner side of the flange hubs must end flushly with the front sides of the shafts (see picture 17).
- Move the power packs in axial direction until you have reached dimension E (see table 1 or 2).
- Secure the flange hubs by tightening the setscrews DIN EN ISO 4029 with cup point (see table 6).

ATTENTION!

For the applications in hazardous areas the setscrews to fasten the hubs as well as all screw connections have to be secured against self-slackening additionally, e. g. by glueing with Loctite (medium-tight).

picture 17: assembly of the flange hubs

Disassembly:

DANGER!

Falling parts can lead to personal injury or damage to the machine.
Secure the driving parts during disassembly.

- Untighten the setscrew in the hub and unscrew it by 2 – 3 convolutions.
- Pull the hub from the shaft.

Schutzvermerk ISO 16016 beachten.	Gezeichnet: 27.02.12 Pz/Wb	Ersatz für: KTR-N vom 17.08.10
	Geprüft: 27.02.12 Pz	Ersetzt durch:

4 Assembly

4.3 Assembly of the Clamping Ring Hub

CAUTION!

The stiffness and dimensions of the shafts (here specifically hollow shafts) have to be selected in a way that sufficient safety against plastic deformation is ensured (if necessary, consult with company KTR).

ATTENTION!

We recommend to check bores and shafts for dimensional accuracy before assembly.

CAUTION!

During the assembly please make sure that the E dimension (see table 1 and 2) is observed, so that the coupling parts do not contact each other during the operation. Disregarding this hint may cause damage on the coupling.

For the axial alignment of the coupling the dimensions E (see table 1 and 2) are decisive. In order to adjust the right dimension E you should proceed as follows:

- Clean and degrease the hub bore and shaft, afterwards lubricate with a thin-bodied oil (e. g. Castrol 4 in 1 or Klüber Quietsch-Ex).

CAUTION!

Oils and greases containing molybdenum disulfide or other high-pressure additives as well as internal lubricants must not be used.

- Slightly detach the clamping screw and pull the clamping ring from the hub only marginally to make sure that the clamping ring is loosened.
- Push the clamping ring hubs onto the shafts of the drive and driven side.
- The inner side of the clamping ring hubs must end flushly with the front sides of the shafts (see picture 18).
- Move the power packs in axial direction until you have reached dimension E (see table 1 or 2).
- Tighten the clamping screws evenly crosswise at first to 1/3 and afterwards 2/3 of the full tightening torque (see table 8). Afterwards tighten the clamping screws crosswise to the full tightening torque. The process needs to be repeated until the tightening torque is achieved for all screws.

picture 18: assembly of the clamping ring hub

Schutzvermerk ISO 16016 beachten.	Gezeichnet: 27.02.12 Pz/Wb	Ersatz für: KTR-N vom 17.08.10

4 Assembly

4.3 Assembly of the Clamping Ring Hub

Table 8: tightening torques of clamping screws

Size	35	38	42	50	60	70	80	85	90	105	115	135
Clamping screws	M5	M6	M6	M8	M8	M10	M12	M12	M12	M12	M12	M16
Tightening torque T_A [Nm]	8,5	14	14	35	35	35	69	120	120	120	120	295

CAUTION!

After the startup of the coupling the tightening torques of the screws has to be inspected during the usual inspection intervals.

ATTENTION!

Selection of clamping hubs

With the use in explosion-proof areas the clamping hubs have to be selected in a way that the difference between the peak torque of the machine including all operation parameters and the frictionally engaged torque of the clamping hub is at least a service factor of $s = 2$.

ATTENTION!

For the applications in hazardous areas the setscrews to fasten the hubs as well as all screw connections have to be secured against self-slackening additionally, e. g. by glueing with Loctite (medium-tight).

Disassembly:

DANGER!

Falling parts can lead to personal injury or damage to the machine.
Secure the driving parts during disassembly.

- Evenly detach the clamping screws successively. Each screw must be detached only half a rotation each revolution. Unscrew all clamping screws by 3 - 4 convolutions.
- Remove the screws situated next to the pull-off threads and screw them into the respective pull-off threads until they fit close.
- The clamping ring is detached by a crosswise and stepwise tightening of the screws in the pull-off threads.

picture 19: disassembly clamping ring hub type 6.0

picture 20: disassembly clamping ring hub type 6.5

- In case of a repeated assembly the hub bore and shaft have to be cleaned and afterwards lubricated with a thin-bodied oil (e. g. Castrol 4 in 1 or Klüber Quitsch EX). The same applies for the taper surfaces of clamping ring hub and clamping ring.

CAUTION!

If these hints are not observed, the operation of the coupling may be damaged.

Schutzvermerk ISO 16016 beachten.	Gezeichnet: 27.02.12 Pz/Wb	Ersatz für: KTR-N vom 17.08.10

4 Assembly

4.4 Assembly of Laminae Packages, RADEX®-N size 20 - 135

CAUTION!

For the assembly please make sure that the laminae packages are assembled in axial direction free from distortion. Disregarding this hint may cause damage on the coupling.

- Clean and degrease the contact surfaces of screw connections on the flange hub, laminae package and spacer.
- Please assemble the laminae packages and the spacer (see picture 21 and 22, respectively). For type NN only 1 laminae package is used (no spacer).
- Screw the components hand-tight initially, the fitting screws to be assembled reciprocally (see picture 21 or 22, respectively).
- Tighten the hexagon nuts one after the other and in several revolutions to the tightening torque mentioned in table 12. Secure the fitting screw against twisting.

picture 21: assembly of the laminae packages RADEX®-N size 20 - 70

picture 22: assembly of the laminae packages RADEX®-N size 80 - 135

Table 9:

4 Assembly

4.5 Assembly of Laminae Packages, RADEX®-N size 136 - 336 and 138 - 338

CAUTION!

For the assembly please make sure that the laminae packages are assembled in axial direction free from distortion. Disregarding this hint may cause damage on the coupling.

- Clean and degrease the contact surfaces of screw connections on the flange hub, laminae package and spacer as well as the threads of the clamping nut and fitting screw.
- Please assemble the laminae packages and the spacer part (see picture 23). For type NN only 1 laminae package is used (no spacer).
- Screw the components hand-tight initially, the fitting screws to be assembled reciprocally (see picture 23). With size 156 and 158 use washer under the screw head.
- Pressure screws in the clamping nut must not jut out the pressure side (see picture 24).

CAUTION!

All components must lay on each other without any gap.

- Afterwards turn back the clamping nut until there is a gap of 1 – 2 mm (see picture 24).
- Tighten the pressure screws marked in picture 26 hand-tight.
- Tighten these screws (see picture 26) at half the tightening torque according to table 11 and afterwards at the full tightening torque according to table 11.
- Now tighten all pressure screws one after another and with several revolutions until all screws have achieved the full tightening torque (picture 27).

CAUTION!

The pressure screws must not bear on the heads after assembly (see picture 25).

- Mount all clamping nuts at the coupling in this way.

laminae package

Pressure screw G ₂ Tightening torque T _A [Nm]	30	30	30	30	60	105	105	105

CAUTION!

Having set the coupling into operation, the tightening torque of the screw connections has to be investigated at regular maintenance intervals.

4 Assembly

4.7 Displacements - Alignment of the Couplings

The displacement figures shown in table 12 offer sufficient safety to compensate for environmental influences like, for example, heat expansion or lowering of foundation.

CAUTION!

In order to ensure a long lifetime of the coupling and to avoid dangers regarding the use in hazardous areas, the shaft ends must be accurately aligned.

Please absolutely observe the displacement figures indicated (see table 12). If the figures are exceeded, the coupling is damaged.

The exacter the alignment of the coupling, the higher is its lifetime.

In case of a use in hazardous areas for the explosion group IIC (marking II 2GD c IIC T X), only the half displacement figures (see table 12) are permissible.

Please note:

- The displacement figures mentioned in table 12 are maximum figures which must not arise in parallel. In case of a simultaneous radial, axial and angular displacement, these values must be reduced (see picture 29).
- Please check with a dial gauge, ruler or feeler whether the permissible displacement figures of table 12 can be observed.

- type NANA 4: flange hub / laminae package / flange hub spec. / intermediate shaft pipe / flange hub spec. / laminae package / flange hub (flange hub spec. with welded intermediate shaft pipe)
- type NNZ: flange hub / laminae package / spacer / laminae package / flange hub
- type NNW: flange hub / laminae package / flange hub / intermediate shaft / flange hub / laminae package / flange hub

RADEX®-N only with spacer made from steel.

5.1 Selection of the Coupling Size

If the coupling is used in explosion proof areas, the size must be selected in a way that there is a minimum safety of $s = 2,0$ from the unit torque to the nominal torque of the coupling.

5.2 Use in Hazardous Areas According to the Regulations

Conditions of operation in hazardous locations

RADEX®-N couplings are suitable for the use according to EC standard 94/9/EC.

1. Industry (with the exception of mining)

- device class II of category 2 and 3 (*coupling is not approved for device class 1*)
- media class G (*gases, fogs, steams*), zone 1 and 2 (*coupling is not approved for zone 0*)
- **media class D (dusts), zone 21 and 22 (coupling is not approved for zone 20)**
- explosion class IIC (*explosion class IIA and IIB are included in IIC*)

Temperature class:

Temperature class	Ambient temperature	Max. surface temperature ¹⁾
T2, T1	- 30 °C to + 280 °C	280 °C ²⁾
T3	- 30 °C to + 190 °C	200 °C ²⁾
T4	- 30 °C to + 125 °C	135 °C ²⁾
T5	- 30 °C to + 90 °C	100 °C
T6	- 30 °C to + 75 °C	85 °C

Explanation:

The maximum surface temperatures result from each the maximum permissible ambient or operating temperature T_a plus the maximum temperature increase ΔT of 10 K which has to be taken into account.

- 1) The ambient or operating temperature T_a , respectively, is limited to + 280 °C by the permissible permanent operating temperature.
- 2) The maximum surface temperature of 110 °C applies for the use in locations which are potentially subject to dust explosion, too.

2. Mining

Device class I of category M2 (coupling is not approved for device category M1).
Permissible ambient temperature - 30 °C to + 140 °C.

Schutzvermerk ISO 16016 beachten.	Gezeichnet: 27.02.12 Pz/Wb	Ersatz für: KTR-N vom 17.08.10

5 Enclosure A

Hints and Instructions Regarding the Use in  Hazardous Areas

5.3 Control Intervals for Couplings in  Hazardous Areas

Explosion group	Control intervals
3G 3D	For couplings which are classified in category 3G or 3D the operating and assembly instructions that are usual for standard operation apply. During the standard operation which has to be subject to the analysis of danger of ignition the couplings are free from any ignition source. Merely the temperature increase produced by proper heating and depending on the coupling type has to be considered: for RADEX®-N: $\Delta T = 10 \text{ K}$
II 2GD c IIB T1, T2, T3, T4, T5, T6	A checking of the circumferential backlash and a visual check of the laminae package must be effected after 3,000 operating hours for the first time, after 6 months at the latest. If you note an unconsiderable or no wear at the laminae package after this first inspection, the further inspections can be effected, in case of the same operating parameters, respectively after 6,000 operating hours or after 18 months at the latest. If you note a considerable wear during the first inspection, so that a change of the laminae package would be recommended, please find out the cause according to the table „Breakdowns“, as far as possible. The maintenance intervals must be adjusted according to the changed operating parameters.
II 2GD c IIC T1, T2, T3, T4, T5, T6	A checking of the circumferential backlash and a visual check of the laminae package must be effected after 2,000 operating hours for the first time, after 3 months at the latest. If you note an unconsiderable or no wear at the laminae package after this first inspection, the further inspections can be effected, in case of the same operating parameters, respectively after 4,000 operating hours or after 12 months at the latest. If you note a considerable wear during the first inspection, so that a change of the laminae package would be recommended, please find out the cause according to the table „Breakdowns“, as far as possible. The maintenance intervals must be adjusted according to the changed operating parameters.

picture 30: RADEX®-N type NANA 1

Schutzvermerk ISO 16016 beachten.	Gezeichnet: 27.02.12 Pz/Wb	Ersatz für: KTR-N vom 17.08.10
	Geprüft: 27.02.12 Pz	Ersetzt durch:

5 Enclosure A

Hints and Instructions Regarding the Use in  Hazardous Areas

5.4 Visual Check and Measures

During the visual control the laminae packages must be checked concerning cracks and detached fitting screws. Detached fitting screws must be tightened with the screw tightening torque to be observed (see table 11). Laminae packages and fitting screws showing cracks must be exchanged immediately, irrespective of the inspection intervals.

picture 31: RADEX®-N type NANA 1

CAUTION!

In order to ensure a long lifetime of the coupling and to avoid dangers regarding the use in hazardous areas, the shaft ends must be accurately aligned. Please absolutely observe the displacement figures indicated (see table 12). If the figures are exceeded, the coupling is damaged.

5.5 Permissible Coupling Materials in the Hazardous Area

In the explosion groups **IIB** and **IIC** only the following material combinations may be used:

- steel - steel
- stainless steel - stainless steel

Aluminium as coupling material is generally excluded for the explosion area.

Schutzvermerk ISO 16016 beachten.	Gezeichnet: 27.02.12 Pz/Wb	Ersatz für: KTR-N vom 17.08.10
	Geprüft: 27.02.12 Pz	Ersetzt durch:

5 Enclosure A

Hints and Instructions Regarding the Use in  Hazardous Areas

5.6 Marking of Coupling for the Hazardous Area

Couplings for the use in hazardous areas are marked on at least one component completely and on the remaining components at the outside diameter of the hub or on the front side with an  label for the respectively permitted conditions of use. The laminae packages are excluded.

Complete labelling:

II 2G c IIC T6, T5, T4, T3 bzw. T2 - $30\text{ °C} \leq T_a \leq +75\text{ °C}$, + 90 °C,
+ 125 °C, + 190 °C bzw. + 280 °C
II 2D c T 110 °C - $30\text{ °C} \leq T_a \leq +100\text{ °C}$ / I M2 c - $30\text{ °C} \leq T_a \leq +140\text{ °C}$

Short labelling:

II 2GD c IIC T X/I M2 c X

The former marking
remains valid:

II 2G c IIC T4/T5/T6 - $30\text{ °C} \leq T_a \leq +80/60/45\text{ °C}$
II 2D c T110°C/I M2 c - $30\text{ °C} \leq T_a \leq +80\text{ °C}$

The labelling with Explosion Group IIC includes the Explosion Groups IIA and IIB.

If the coupling part is labelled with  in addition to , KTR supplied it unbored or pilot bored.

CAUTION!

Any mechanical rework to couplings that are used in hazardous areas require an explicit release by KTR.

The orderer must send a drawing to KTR acc. to which the manufacture must be made. KTR checks this drawing and returns it to the orderer with approval.

5.7 Starting

Before putting the coupling into operation, check the tightness of the setscrews in the flange hubs, the alignment and the distance dimension E and correct, if necessary, and also check all screw connections regarding the stipulated tightening torques dependent on the type of coupling.

If used in hazardous areas the setscrews to fix the flange hub as well as all screw connections must be additionally secured against self-loosening, e. g. glue with Loctite (medium strength).

Last but not least, the coupling protection against unintended contact must be fixed.

The cover must be electrically conductive and be included in the equipotential bonding. Bell housings (magnesium part below 7,5 %) made from aluminium and damping rings (NBR) can be used as connecting element between pump and electro motor. The cover may only be taken off after having stopped the unit.

During operation, please pay attention to

- strange running noises
- occurring vibrations.

If the couplings are used in dust explosive areas and in mining the user must make sure that there is no accumulation of dust in a critical quantity between the cover and the coupling. The coupling must not operate in an accumulation of dust.

Schutzvermerk ISO 16016 beachten.	Gezeichnet: 27.02.12 Pz/Wb	Ersatz für: KTR-N vom 17.08.10
	Geprüft: 27.02.12 Pz	Ersetzt durch:

5 Enclosure A

Hints and Instructions Regarding the Use in Hazardous Areas

5.7 Starting

For covers with unlocked openings on the upper side no light metals may be used if the couplings are used as appliances of appliance group II (*if possible, from stainless steel*).

If the couplings are used in mining (appliance group I M2), the cover must not be made from light metal. In addition, it must be resistant to higher mechanical loads than if it is used as appliance of appliance group II.

The minimum distance „Sr“ of the protection device to the rotating parts must at least correspond to the figures mentioned below.

If the protection device is used as cover, regular openings complying with the explosion protection demands can be made that must not exceed the following dimensions:

Openings	Cover [mm]		
	Top side	Lateral parts	Distance „Sr“
Circular - max. diameter	4	8	≥ 10
Rectangular - max. lateral length	4	8	≥ 10
Straight or curved slot - max. lateral length/height	prohibited	8	≥ 20

CAUTION!

If you note any irregularities at the coupling during operation, the drive unit must be turned off immediately. The cause of the breakdown must be found out with the table „Breakdowns“ and, if possible, be eliminated according to the proposals. The possible breakdowns mentioned can be hints only. To find out the cause all operating factors and machine components must be considered.

Coupling layer:

If coated (priming, painting etc.) couplings are used in hazardous areas, the requirements to conductability and layer thickness must be considered. In case of paintings up to 200 µm no electrostatic load can be expected. Multiple coatings that are thicker than 200 µm are prohibited for explosion group IIC.

5.8 Breakdowns, Causes and Elimination

The below-mentioned errors can lead to an incorrect use of the **RADEX®-N** coupling. In addition to the stipulations in these operating and mounting instructions please make sure to avoid these errors.

The errors listed can only be clues to search for the errors. When searching for the error the adjacent components must be generally included.

Due to incorrect use the coupling can become a source of ignition. EC Standard 94/9/EC requires a special care from the manufacturer and the user.

General errors incorrect use:

- Important data for the coupling selection was not forwarded.
- The calculation of the shaft/hub connection was not considered.
- Coupling parts with damage occurred during transport are assembled.
- If the heated hubs are assembled, the permissible temperature is exceeded.
- The fits of the parts to be assembled are not coordinated with each other.
- Tightening torques are below/exceeded.

Hints and Instructions Regarding the Use in  Hazardous Areas

5.8 Breakdowns, Causes and Elimination

Continuation:

- Components are exchanged by mistake/put together incorrectly.
- A wrong or no laminae package is inserted into the coupling.
- No original KTR parts (purchased parts) are used.
- The coupling used/the coupling protection used is not suitable for the operation in hazardous areas and does not correspond to EC Standard 94/9/EC, respectively.
- Maintenance intervals are not observed.

Breakdowns	Causes	Danger hints for hazardous areas	Elimination
Change of the running noises and / or occurring vibrations	Misalignment	---	<ol style="list-style-type: none"> 1) Put the unit out of operation 2) Eliminate the reason for the misalignment (e. g. loose foundation bolts, break of the engine fixing, heat expansion of unit components, change of the assembly dimension E of the coupling) 3) Checking of wear see under point Control
	Loose fitting screws, low micro friction under the screw head and at the steel laminae package	Danger of ignition due to hot surfaces	<ol style="list-style-type: none"> 1) Put the unit out of operation 2) Check coupling parts and exchange damaged coupling parts 3) Tighten the shoulder bolts until reaching the permissible tightening torque 4) Check alignment, correct if necessary
	Loose screws for axial securement of flange hubs	---	<ol style="list-style-type: none"> 1) Put the unit out of operation 2) Check alignment of coupling 3) Tighten the screws to secure the flange hubs and secure against self-loosening 4) Checking of wear see under point Control
Break of the steel laminae package	Break of the steel laminae package due to high shock energy / overload	Danger of ignition due to sparking	<ol style="list-style-type: none"> 1) Put the unit out of operation 2) Disassemble the coupling and remove the rests of the steel laminae packages 3) Check coupling parts and exchange damaged coupling parts 4) Insert steel laminae packages, assemble coupling parts 5) Find out the reason of overload
	Operating parameters do not correspond to the performance of the coupling	Danger of ignition due to sparking	<ol style="list-style-type: none"> 1) Put the unit out of operation 2) Check the operating parameters and select a larger coupling (consider installation space) 3) Assemble new coupling size 4) Check alignment

5 Enclosure A

Hints and Instructions Regarding the Use in  Hazardous Areas

5.8 Breakdowns, Causes and Elimination

Breakdowns	Causes	Danger hints for hazardous areas	Elimination
Break of the steel laminae package	Mistake in service of the unit	Danger of ignition due to sparking	<ol style="list-style-type: none"> 1) Put the unit out of operation 2) Disassemble the coupling and remove the rests of the steel laminae packages 3) Check coupling parts and exchange damaged coupling parts 4) Insert steel laminae packages, assemble coupling parts 5) Instruct and train the service staff
Cracks in / break of the steel laminae packages / fixing screws	Drive vibrations	Danger of ignition due to sparking	<ol style="list-style-type: none"> 1) Put the unit out of operation 2) Disassemble the coupling and remove the rests of the steel laminae packages 3) Check coupling parts and exchange damaged coupling parts 4) Insert steel laminae packages, assemble coupling parts 5) Check alignment, correct if necessary 6) Find out the reason for the vibrations

If you operate with a worn laminae package (see item 5.2) and the subsequent contact of metal parts a due operation meeting the explosion protection requirements and acc. to Standard 94/9/EC is not ensured.

ATTENTION!

KTR does not assume any liabilities or guarantees regarding the use of spare parts and accessories which are not provided by KTR and for the damages resulting herefrom.

Hints and Instructions Regarding the Use in  Hazardous Areas

5.9 EC Certificate of Conformity

EC Certificate of Conformity

corresponding to EC Standard 94/9/EC dated 23 March 1994
and to the legal regulations

The manufacturer - KTR Kupplungstechnik GmbH, D-48432 Rheine - states that the

RADEX®-N Steel Laminae Couplings

described in these mounting instructions and explosion-proof designed correspond to Article 1 (3) b) of Standard 94/9/EC and comply with the general Safety and Health Requirements according to enclosure II of Standard 94/9/EC.

The RADEX®-N steel laminae coupling is in accordance with the specifications of the standard 94/9/EC. One or several standards mentioned in the corresponding EC type test certificate IBExU02ATEXB005_05 X were in part replaced by updated versions. KTR Kupplungstechnik GmbH as the manufacturer confirms that the product mentioned above is in accordance with the specifications of the new standards, too.

According to article 8 (1) of Standard 94/9/EC the technical documentation is deposited with the:
