

Fire Alarm Systems

Fire alarm systems are one of our highest selling products. We offer a fully comprehensive range of systems, so we will easily be able to meet even the most demanding requirements.

Fire alarm systems are a strongly suggested commodity, we believe no premises should be without the safety a fire alarm offers. Listed below are the different types of alarm systems available, please feel free to discuss your needs with one of our trained specialist advisers.

- **Conventional** – A more traditional alarm system, able to detect fire or the effects of fire, and as a result provides one or more of the following;
 - notifies the occupants
 - notifies persons in the surrounding area
 - summons the fire service
 - controls all the fire alarm components in a building.

- **Analogue Addressable** – This type of fire alarm system is extremely useful in larger premises as each unit can give its exact location via a text read out, meaning fires can be quickly located.

- **Radio** - Radio fire systems are simple to install. There is no need for wiring between detection devices and very little disruption of the premises during installation.

- **Aspirated System** - A type of smoke detector which gives a very quick response. It detects smoke particles suspended in the air by identifying the light scattered from the particles in a sampling chamber.

- **Voice Alarm** – The Emergency Voice Alarm Communication system is required in large facilities where general undirected evacuation is considered impracticable. Highly recommended for use in Public buildings and places of entertainment.
