

U.P.S

UPS stands for Uninterruptible Power Supply: This system is a device which maintains a continuous supply of electricity to connected equipment by supplying power from a separate source when there is a power outage.

Power outages can cause real problems for businesses, even minor power fluctuations can cause computers to freeze or shut down, resulting in lost time and data. Seeing as most businesses store information on a computer or file server it is advisable that there is a system in place to prevent data loss. A UPS system can offer peace of mind.

There are two different types of UPS device, off-line UPS and on-line UPS. An off-line UPS remains idle until a power failure occurs, and then switches from utility power to its own power source. An on-line UPS continuously powers the protected load from its batteries, while simultaneously replenishing the reserves from the AC power.

As UPS systems range in size and voltage, Technical Alarm Systems are happy to advise you on the best system for your company.
